On the basis of results provided by studies on the work  
of the cultivator on slopes the following conclusions may  
be drawn: (1) The angle of throw increases on compact  
soils; (2) Round-trip passage of the cultivator along the  
contour line results in larger downward displacement of  
soil particles in places where the first passage had been  
effected down the slope; (3) The first passage along the  
contour line brings about larger displacement of soil

Harrow operation on a slope along the contour line in  
soil particles displacement approximately 10.5 cm down  
the slope. Average, upward and downward displace-  
ments along the largest slope gradient are 12.9 cm and  
34.8 cm respectively. The work harrow at an angle of  
45° to the contour line produces upward and downward  
displacements of 7.5 cm and 25.1 cm respectively. An  
anti-erosive effect of cultivation may be attained if the
